

Various gadgets

Here you find a small selection of partly unnecessary and useless gadgets that are for sure not needed.

electronic compass

It's a toy that does not help you in any way. The electronic compass is not precise and it would be culpable to rely on it (partly deflected by the magnetic emissions of the wiring inside the vehicle. Calibration (if it works) would be very cumbersome. I just need the device because it also displays outside/inside temperature and battery charge.

Deviation angle gauge

It is also a toy. When it is not precisely calibrated, it causes more evil than good. A real offroader knows when the maximum inclined position of the vehicle is reached. In addition, this changes according to roof load. Only advantage is when parking the car evenly for camping. But the trained eye will solve this issue also without this gauge.

Sidewise air deflector

Indeed, such an air deflector helps making driving with open windows more comfortable. The bothersome buzzing in one's ears is almost completely removed. However, the question remains whether the window really has to be wide open while driving or whether it would be sufficient to open the air flaps (Landrover) or the dormer window for acceptable cooling during hot days.

Cup holder

This is my small do-it-yourself making. It is quite useful for long drives. There is room for two (small) bottles. Advantage: They are firmly placed and cannot roll over the entire cabin. The cup holder is also suited to store other things (eg. Lollipops, sweets etc).
